

Operational intelligence scan

Where the operation loses signal.

A sample diagnostic of fragmented monthly management reporting.

Case

SIGNAL-260729-071

Sector

Finance

Scope

Monthly reporting

Sample diagnostic only. Findings and estimates require validation and do not constitute an offer.

Executive snapshot

Situation / reported

The monthly reporting workflow crosses seven source systems. Analysts collect files from email and portals, normalise them in spreadsheets, investigate differences through email and copy approved figures into the final reporting layer.

Reported effort

16-30 h

Per monthly cycle. Validate against two representative cycles.

Source systems

7

Email, portals, ERP exports, spreadsheets and business intelligence.

Readiness

Medium

Process is visible. Access and source ownership still need proof.

Priority signals

Source-to-output lineage is incomplete

1

Numbers can be reproduced, but the path from source file to approved output is partly manual.

High impact

Exceptions operate outside a visible queue

2

Missing inputs and mapping differences are resolved in email without shared categories or ownership.

High impact

Mapping logic lives in analyst spreadsheets

3

Business logic is reusable but not centrally governed, measured or tested.

Medium impact

Evidence confidence

78%

Priority field

Impact × feasibility / confidence shown by outline

Priority order

- 1 Lineage**
Trace every reported figure to its source and transformation.
High confidence
- 2 Exceptions**
Create one owned exception queue with resolution evidence.
Medium confidence
- 3 Mapping logic**
Move stable mappings into governed and tested rules.
Medium confidence
- 4 Approval timing**
Measure approval latency before changing the approval model.
Low confidence

Readiness

Current workflow map

Reported process / one monthly cycle

Handoffs and fractures

#	Step	Owner	Observed fracture	Evidence
1	Source intake	Operations analyst	Inputs arrive at different cut-offs	Reported
2	Normalisation	Operations analyst	Mapping rules live in workbook tabs	Reported
3	Exception review	Controller	Resolution happens in email threads	Reported
4	Approval	Finance lead	No measured approval cycle time	Inferred
5	Publication	Analyst	Lineage to final BI figure is manual	Reported

Validate next

Observe two complete reporting cycles. Capture file arrival times, exception categories, mapping changes, approval timestamps and the exact path from source line item to final output.

Ten blind spots

Unresolved questions, ordered by decision value

1

Ownership

Who owns each source at cut-off?

2

Data

Which input is authoritative when figures disagree?

3

Stability

How often do mapping rules change?

4

Impact

What percentage of cycles require material rework?

5

Control

Where are exception reasons recorded?

6

Feasibility

Can each source be accessed by export or API?

7

Governance

Which approvals require maker-checker separation?

8

Compliance

What retention rule applies to source evidence?

9

Adoption

Who would own a pilot and measure benefit?

10

Process

What is the accepted reporting cut-off policy?

Confidence rule

Missing evidence does not erase a potentially severe problem. High-impact, low-confidence findings are labelled "Validate next" and carried into the first workshop agenda.

Solution variants and roadmap

Validate before scope

Indicative options, not a final offer

A

Variant

Process-first control

Standard input template, cut-off policy and one exception taxonomy.

Time 1-2 weeks

Delivery Low complexity

Indicative EUR 8k-15k

B

Recommended

Reusable workflow

Ingestion, schema mapping, validation rules, evidence lineage and owned exception queue.

Time 4-6 weeks

Delivery Medium complexity

Indicative EUR 35k-65k

C

Variant

Agent-assisted review

Draft exception analysis and reporting commentary with human approval and complete traceability.

Time 6-10 weeks

Delivery Medium-high complexity

Indicative EUR 60k-110k

Recommended roadmap

0-30 days

Validate two cycles

Confirm sources, mappings, exceptions and owners.

30-90 days

Pilot the workflow

Automate ingestion and evidence lineage for one reporting pack.

3-6 months

Add agent assistance

Introduce exception investigation after controls are proven.

Next step. Run a 90-minute evidence review with the process owner, controller and systems lead. Čeština: Připraveno pro lokalizaci.

Estimates are indicative and do not constitute an offer.
